

Improving Patient Outcomes

PromptCare Home Infusion is the company to choose in servicing your patient with their home Inotropic therapy as you bridge them to destination; whether it be Transplant, LVAD or Palliative we can customize a plan with you and your team.

PromptCare Home Infusion's Cardiac Transitions Program

PromptCare[®]. Providing Customized Care from the Comfort of Home.

“PromptCare is invested in my patients’ well-being, and are very good with clinically complicated cases; that’s their specialty. PromptCare is my first choice for heart failure patients.”

— Case Manager, New Jersey

PromptCare’s Cardiac Transitions Programs utilizes a customized and innovative team approach to support and educate Stage D heart failure patients and their caregivers on Inotropic infusions to improve each patient’s quality of life. Our team of expert heart failure clinical nurse liaisons, cardiac clinical pharmacists, heart failure-educated infusion nurses and cardiac insurance specialists work collaboratively with the hospital and physician to ensure each patient experiences a seamless transition home to prevent hospital readmissions. We achieve this through early screening for medication/ insurance/ social issues and close personalized ongoing patient follow up throughout the program. It’s the reason we’re trusted by more cardiologists with the most clinically complex end-stage heart failure patients.

Highlights of PromptCare’s Cardiac Transitions program include:

- An enhanced assessment of post-discharge needs
- A 24-hour post discharge visit by an RN
- Vigilant follow-up post hospital discharge or after periods of instability
- 24/7 access to PromptCare pharmacists and nurses
- Enabling medication compliance to reinforce the HF’s “guideline directed management” as prescribed by their Cardiology team.
- Use of a primary nursing model
- Ongoing education with an emphasis on strategies to increase adherence to the patient’s treatment plan
- Access to adjunct therapy kit
- Follow-up on the patient’s progress with members of the healthcare team
- Ongoing monitoring for signs and symptoms of fluid overload or changes in lab test results
